Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) A pluggable transceiver comprising:

a housing having a front end configured to couple to a transmission cable and a back end configured to be inserted into a cage; and

a cam disposed on an exposed outer surface of the transceiver housing and configured to displace a cage latch and engage a cage slot upon insertion of the transceiver housing into engage the transceiver within the cage; and

a release mechanism attached to the housing and selectively movable between at least a first position and a second position, where the release mechanism is in the first position when the transceiver is engaged within the cage and is moved into the second position to disengage the transceiver from the cage.

No.: 12754-051001 / 00P7411

- 2. (Original) The pluggable transceiver of claim 1, wherein the cam has a chamfered surface exposed for contact with the cage latch as the transceiver is being inserted into the cage.
- 3. (Original) The pluggable transceiver of claim 2, wherein the chamfered surface of the cam is rectangular.
- 4. (Original) The pluggable transceiver of claim 2, wherein the chamfered surface of the cam tapers from the front end to the back end of the transceiver housing.
- 5. Cancelled
- 6. (Currently Amended) The pluggable transceiver of claim 1 5, wherein the release mechanism comprises a release block configured to slide into the second position engagement with the cage latch to disengage the cam transceiver from the cage slot.

Serial No.: 09/672,571

Filed: September 27, 2000

7. (Original) The pluggable transceiver of claim 6, wherein the release block comprises a chamfered surface exposed for contact with the cage latch.

No.: 12754-051001 / 00P7411

8. (Currently Amended) A cage <u>configured to receive a pluggable transceiver having a transceiver cam</u>, comprising:

a housing having a front end for receiving [[a]] the pluggable transceiver and defining a slot for engaging [[a]] the transceiver cam; and

a latch disposed at the front end of the cage housing and configured to bend outwardly from an original position in response to a force applied by the transceiver cam as the transceiver is being inserted into the cage and to resiliently return to the original position upon engagement of the transceiver cam with the slot defined in the front end of the cage housing, wherein the latch includes a front end having an inner surface that flares outwardly away from an interior region of the cage housing.

9. Cancelled.

10. (Original) The cage of claim 8, wherein the cage housing is configured to shield against electromagnetic interference.

- 11. (Original) The cage of claim 8, further comprising an ejection mechanism configured to engage and apply an ejection force against the pluggable transceiver when disposed within the cage housing.
- 12. (Original) The cage of claim 8, further comprising a circuit card connector disposed in a back end of the cage housing and configured to couple the pluggable transceiver to a circuit card.
- 13. (Original) The cage of claim 8, wherein the cage latch is formed integrally with the cage housing.
- 14. (Original) The cage of claim 8, wherein the cage housing is configured to engage an opening in an electromagnetic enclosure.

15. (Currently Amended) A data coupling system, comprising:

a pluggable transceiver comprising a housing having a front end configured to couple to a transmission cable, and a cam disposed on an exposed outer surface of the transceiver housing; and

No.: 12754-051001 / 00P7411

a cage comprising a housing having a front end for receiving the pluggable transceiver and defining a slot for engaging the transceiver cam, and a latch disposed at the front end of the cage housing, the latch including a front end having an inner surface that flares outwardly away from an interior region of the cage housing;

wherein the transceiver cam is configured to displace the cage latch and engage the cage slot upon insertion of the transceiver housing into the cage, and the cage latch is configured to bend outwardly from an original position in response to a force applied by the transceiver cam as the transceiver is being inserted into the cage and to resiliently return to the original position upon engagement of the transceiver cam and the slot defined in the front end of the cage housing.

- 16. (Original) The data coupling system of claim 15, wherein the cam has a chamfered surface exposed for contact with the cage latch as the transceiver is being inserted into the cage.
- 17. (Original) The data coupling system of claim 15, further comprising a release mechanism disposed on a surface of the transceiver housing and configured to disengage the cam from the cage slot.
- 18. (Original) The data coupling system of claim 17, wherein the release mechanism comprises a release block configured to slide into engagement with the cage latch to disengage the cam from the cage slot.
- 19. (Original) The data coupling system of claim 18, wherein the release block comprises a chamfered surface exposed for contact with the cage latch.
- 20. (Original) The data coupling system of claim 15, wherein the cage further comprises an ejection mechanism configured to engage and apply an ejection force against the pluggable transceiver when disposed within the cage housing.

21. (New) The data coupling system of claim 17, wherein the release mechanism is selectively movable between at least a first position and a second position, where the release mechanism is in the first position when the transceiver is engaged within the cage and is moved into the second position to disengage the transceiver from the cage.

et No.: 12754-051001 / 00P7411

22. (New) The cage of claim 8, wherein the housing further includes an upper portion, a lower portion and at least two sidewalls thereby forming an interior region and wherein the pluggable transceiver is received into the interior region.

23. (New) The cage of claim 21, wherein the upper portion of the housing includes one or more resilient springs that are configured to engage an opening in a panel of an electromagnetically shielded electronic equipment enclosure.

24. (New) A cage configured to receive a pluggable transceiver having a transceiver cam, comprising:

a housing having a front end for receiving the pluggable transceiver and defining a slot for engaging the transceiver cam; and

a latch disposed at the front end of the cage housing and configured to bend outwardly from an original position in response to a force applied by the transceiver cam as the transceiver is being inserted into the cage and to resiliently return to the original position upon engagement of the transceiver cam with the slot defined in the front end of the cage housing, wherein the cage housing is configured to shield against electromagnetic interference.

- 25. (New) The cage of claim 24, wherein the latch includes a front end having an inner surface that flares outwardly away from an interior region of the cage housing.
- 26. (New) The cage of claim 24, further comprising an ejection mechanism configured to engage and apply an ejection force against the pluggable transceiver when disposed within the cage housing.
- 27. (New) The cage of claim 24, further comprising a circuit card connector disposed in a back end of the cage housing and configured to couple the pluggable transceiver to a circuit card.
